- Acknowledgements
Introduction

Preliminary Remarks

- The intention of this presentation is to provide up-to-date information. However, facts and figures change rapidly, and the given information may soon be outdated again.

- This work has been carried out under the responsibility of Dr. Simon Philipps (Fraunhofer ISE) and Werner Warmuth (PSE Projects GmbH).

- Price indications are always to be understood as nominal, unless this is stated explicitly. For example, prices in the learning curves are inflation adjusted.

- The slides have been made as accurate as possible and we would be grateful to receive any comments or suggestions for improvement. Please send your feedback to simon.philipps@ise.fraunhofer.de and also to warmuth@pse-projects.de

- Please quote the information presented in these slides as follows: ©Fraunhofer ISE: Photovoltaics Report, updated: 24 February 2022

*preliminary estimates*
Executive Summary
PV Market: Global

- Photovoltaics is a fast-growing market: The Compound Annual Growth Rate (CAGR) of cumulative PV installations including off-grid was 34% between year 2010 to 2020.

- In 2020 producers from Asia count for 95% of total c-Si PV module production. China (mainland) holds the lead with a share of 67%. Europe contributed with a share of 3%; USA/CAN with 2%.

- Wafer size increased and by keeping the number of cells larger PV module sizes are realized allowing a power range beyond 600 W per module.

- In 2020, Europe’s contribution to the total cumulative PV installations amounted to 22% (compared to 24% in 2019). In contrast, installations in China accounted for 33% (same value as the year before).

- Si-wafer based PV technology accounted for about 95% of the total production in 2020. The share of mono-crystalline technology is now about 84% (compared to 66% in 2019) of total c-Si production.

- Market shifts from subsidy driven to competitive pricing model (Power Purchase Agreements PPA).
Executive Summary
PV Market: Focus Germany

- In year 2020, Germany accounted for about 7.6% (53.6 GWp) of the cumulative PV capacity installed worldwide (707.5 GWp) with about 2 million PV systems installed in Germany. In 2021 the newly installed capacity in Germany was 5.3 GWp; in 2020 it was 4.6 GWp.

- PV covered 9.9% of Germany’s net electricity generation in 2021 while all Renewable sources delivered about 45.9%.

- In 2020 about 35 Mio. t CO₂ equivalent GHG emissions have been avoided due to 50.6 TWh electrical energy generated by PV in Germany.

- PV system performance has strongly improved. Before 2000 the typical Performance Ratio was about 70%, while today it is in the range of 80% to 90%.
Executive Summary

Solar Cell / Module Efficiencies

- The record lab cell efficiency is 26.7% for mono-crystalline and 24.4% for multi-crystalline silicon wafer-based technology. The highest lab efficiency in thin film technology is 23.4% for CIGS and 21.0% for CdTe solar cells. Record lab cell efficiency for Perovskite is 25.5%.

- In the last 10 years, the efficiency of average commercial wafer-based silicon modules increased from about 15% to 20% and more. At the same time, CdTe module efficiency increased from 9% to 19%.

- In the laboratory, best performing modules are based on mono-crystalline silicon with 24.4% efficiency. Record efficiencies demonstrate the potential for further efficiency increases at the production level.

- In the laboratory, high concentration multi-junction solar cells achieve an efficiency of up to 47.1% today. With concentrator technology, module efficiencies of up to 38.9% have been reached.
Executive Summary
Energy Payback Time

- Material usage for silicon cells has been reduced significantly during the last 16 years from around 16 g/Wp to about 3 g/Wp due to increased efficiencies, thinner wafers and diamond wire sawing as well as larger ingots.

- The Energy Payback Time of PV systems is dependent on the geographical location: PV systems in Northern Europe need around 1.2 years to balance the input energy, while PV systems in the South equal their energy input after 1 year and less, depending on the technology installed and the grid efficiency.

- A PV system located in Sicily with wafer-based Silicon modules has an Energy Payback Time of around one year. Assuming 20 years lifespan, this kind of system can produce twenty times the energy needed to produce it.
Executive Summary

Inverters

- Inverter efficiency for state-of-the-art brand products is 98% and higher.
- The market share of string inverters is estimated to be 64%. These inverters are mostly used in residential, small and medium commercial applications in PV systems up to 150 kWp. The market share of central inverters, with applications mostly in large commercial and utility-scale systems, is about 34%.
  A small proportion of the market (about 1%) belongs to micro-inverters (used on the module level). The market share for DC/DC converters, also called “power optimizers”, is estimated to be 5% of the total inverter market.
- Trends: Digitalisation, Repowering, new features for grid stabilization and optimization of self-consumption; storage; utilization of innovative semiconductors (SiC or GaN) which allow very high efficiencies and compact designs; 1500 V maximum DC string voltage.
Executive Summary

Price Development

- In Germany prices for a typical 10 to 100 kWp PV rooftop-system were around 14,000 €/kWp in 1990. At the end of 2020, such systems cost only 7.4% of the price in 1990. This is a net-price regression of about 92% over a period of 30 years.

- The Experience Curve – also called Learning Curve - shows that in the last 40 years the module price decreased by 26% with each doubling of the cumulated global module production. Cost reduction results from economies of scale and technological improvements.
1. PV Market

- By region
- By technology
PV Module Production by Region 1990-2020
Percentage of Total MWp Produced

About 82% of the global PV module has been produced in Asia in year 2010. It increased to about 92% of total global production in year 2020. China (mainland) accounted with about 97 GW for 67% of the global module production in year 2020. The annual production has increased by a factor of 7 in this decade.
Current European c-Si PV Manufacturing Landscape
Status Quo, End of 2020

Total capacities within the EU [GWp/a]:
- **Module**: 6.75
- **Solar cell**: 0.65
- **Ingot & Wafer**: 1.25
- **Poly-Si**: 22.1
- **mg-Si**: 30.2

### Production Capacity mg-Si / poly-Si (1000 10 kg/a)

- > 500 MWp
- > 100 MWp
- > 50 MWp

Data and Graph: Jochen Rentsch, Fraunhofer ISE 2021
Global Cumulative PV Installation
From 2010 to 2020

Data: IRENA 2021. Graph: PSE 2021. Date of data: Apr-2021
The total cumulative installations amounted to about 710 GWp at the end of year 2020.

All percentages are related to global installed PV capacity, including off-grid systems.
The annual distribution of PV System size classes strongly depend on:

- Regulations
- Market incentives (like EEG)
- Tender procedures
- Bankability (trust of investors)

Source: Fraunhofer ISE, own calculations based on EEG-master and -flow data (netztransparenz.de, Sept. 2021)
End of 2020 about 2 million grid-connected PV-Systems were installed in Germany.

Source: Fraunhofer ISE, own calculations based on Markstammdatenregister (BNetzA; Sept. 2021)
At the end of 2020 a total cumulated PV capacity of about 54 GW was installed in Germany.

Source: Fraunhofer ISE, own calculation based on Markstammdatenregister and EEG-master data (netztransparenz.de, September 2021; BNetzA; September 2021)
136.8 GW of total 234.2 GW net installed electricity generation capacity in Germany were from renewable energy (RE) sources in Germany in year 2021. This results in a RE share of 58.4% of total capacity.

Data: Energy Charts by Prof. Dr. Bruno Burger. Date of data: Jan-2022
In 2020 Greenhouse Gas emissions of about 35 Mio. t CO₂-equivalent were avoided due to 50.6 TWh PV electricity consumed in Germany.

Data: BMU, BDEW, BMWi, Federal Environmental Agency (UBA) 2021. Graph: PSE 2021
About 150* GWp PV module production in 2020

*2020 production numbers reported by different analysts vary to some extend. Different sources report a total PV module production between 137 and 152 GWp for year 2020.

Data: from 2000 to 2009: Navigant; from 2010: IHS Markit. Graph: PSE 2021. Date of data: Jun-2021
PV Production by Technology

- Unpassivated (Lab.)
- Passivated emitter (Lab.)
- PERx (Lab.)
- Passivating Contacts (Lab.)
- Tandem (Lab.)

Graph: Fraunhofer ISE 2021

M. Hermle, ETIP PV Conference, Brussels (2017)
Current Efficiencies and Power of Commercial PV Modules
Sorted by technology

Total weighted average efficiency of crystalline Silicon(c-Si) wafer-based modules is **20.4%** in Q4-2021 (weighting factor is total shipments in year 2020). Lowest module efficiency in this group is 16.3% and highest value is 22.4%.

Top 10 manufacturers represent about 78% of total shipment volume and origin mainly in Asia.

Predominant c-Si technology is mono-PERC with half-cut cells and Multi-Busbar.

Note: Selection based on modules of Top10 manufacturers in year 2020 (exception CIGS) with global available module data sheets at end of Oct-2021.
Performance Ratio Development for PV Systems

Germany

In the 1990’s
- Typical PR ~70 %
- Widely ranging PR values

Today
- Typical PR ~83 %
- Less variance in PR as compared to 1990’s

Source: Fraunhofer ISE “1000 Dächer Jahresbericht” 1994 and 1997; 2011 system evaluation, CPIA 2021
3. Energy Return of Invest (EROI) & Energy Payback Time (EPBT)

- Silicon usage, wafer thickness and kerf loss for c-Si
- EPBT: Development and comparison
c-Si Solar Cell Development
Wafer Thickness [µm] & Silicon Usage [g/Wp]

Data: until 2012: EU PV Technology Platform Strategic Research Agenda, from 2012: ITRPV 2015; ISE 2016 without; 2017 to 2020 with recycling of Si. Graph: PSE Projects GmbH 2021
Learning Rate:
Each time the cumulative production doubled, the EPBT went down by 12.8% for the last 24 years.
Energy Pay-Back Time of Silicon PV Rooftop Systems
Geographical Comparison

- Rooftop PV-system using mono-crystalline Silicon cells* produced in China
- EPBT is dependent on irradiation, but also on other factors like grid efficiency**.
- Better grid efficiency in Europe may decrease the EPBT by typically 9.5 % compared to PV modules produced in China.

Data: Lorenz Friedrich, Fraunhofer ISE. Image: JRC European Commission. Graph: PSE 2020 (Modified scale with updated data from Fraunhofer ISE)

*Cz PERC cells module with 19.9% efficiency
**relation between primary energy to produced electricity in the grid used for manufacturing of the PV system
World Map EPBT of Silicon PV Rooftop Systems – Comparison of EPBT China

Influencing factors and interpretation:

- EPBT: The lower, the better
- Irradiation: The higher, the better
- Grid efficiency: The higher, the better in countries where upstream production is located; (better energy mix to generate electrical power; less losses in the electrical transmission network). At downstream (where PV is installed) a low grid efficiency reduces the EPBT.

EPBT = Energy Pay Back Time in years: Calculated for PV-system with Cz PERC 60 cells modules with 19.9 % efficiency produced in China

Data: Lorenz Friedrich, Fraunhofer ISE. Graph: PSE 2020
EPBT for PV systems produced in Europe is shorter than for those produced in China because of better grid efficiency in Europe.

Data: Lorenz Friedrich, Fraunhofer ISE. Design: PSE 2020
4. Inverters

- Inverter/Converter Market
### Inverter/Converter Market 2020

<table>
<thead>
<tr>
<th>Inverter / Converter</th>
<th>Power</th>
<th>Efficiency (DC/AC)</th>
<th>Market Share (Estimated)*</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>String Inverters</td>
<td>up to 150 kWp</td>
<td>up to 98%</td>
<td>64.4%</td>
<td>• 3 - 17 €-cents/Wp&lt;br&gt;• Easy to replace</td>
</tr>
<tr>
<td>Central Inverters</td>
<td>More than 80 kWp</td>
<td>up to 98.5%</td>
<td>33.7%</td>
<td>• 3 - 5 €-cents/Wp&lt;br&gt;• High reliability&lt;br&gt;• Often sold only together with service contract</td>
</tr>
<tr>
<td>Micro-Inverters</td>
<td>Module Power Range</td>
<td>90%-97%</td>
<td>1.4%</td>
<td>• ~ 25 €-cents/Wp&lt;br&gt;• Ease-of-replacement concerns</td>
</tr>
<tr>
<td>Power Optimizer</td>
<td>Module Power Range</td>
<td>up to 99.5%</td>
<td>5.1%</td>
<td>• ~ 8 €-cents/Wp&lt;br&gt;• Ease-of-replacement concerns&lt;br&gt;• Output is DC with optimized current&lt;br&gt;• Still a DC / AC inverter is needed</td>
</tr>
</tbody>
</table>

*Total Market Share related to shipment in MWac is greater than 100% because DG/DC converters are required to be paired with string inverters.
5. Price Development

- Electricity costs
- Market incentives in Germany
- Costs for PV systems
- Price Learning Curve
Electricity Prices, PV Feed-In Tariffs (FIT) and bidding scheme in Germany

Electricity costs
- Household 1 000 kWh/a to 2 500 kWh/a incl. VAT (2000-2020: +3.4%/a)
- Household 2 500 kWh/a to 5 000 kWh/a incl. VAT (2000-2020: +3.7%/a)
- Industry 500 MW/h/a to 2 GW/h/a net price (2000-2020: +4.2%/a)
- Industry 20 GW/h/a to 70 GW/h/a net price (2000-2020: +2.2%/a)
- Day-Ahead EPEX-Spot Price

PV bidding scheme
- PV large freestanding systems average weighted annual bid values (2015-2020: -9.5%)

Feed-in tariff for PV
- PV Rooftop up to 10 kW (2000-2020: -8.2%/a)
- PV freestanding since 10/2015 up to 100 kWp (2000-2020: -9.5%/a; fixed FIT)

Data: BMU and BMWi Energiedaten 2020. Design: B. Burger - Fraunhofer ISE. Date of data: Feb.2021

Data: BNA. Graph: B. Burger, Fraunhofer ISE. Energy-Charts. Date of Data: 31-Jan-2022
PV-Tender in Germany
Average, quantity weighted Award Value

Lowest PV-Tender Round was in Feb. 2018 with 4.33 ct€ / kWh as average quantity weighted award price.

PV-Tender scheme started in April 2015 and total capacity of this scheme accumulates to 5.8 GW by Nov-2021 with 5.00 ct€ / kWh as latest average quantity weighted award price.

Special tenders are not displayed in the graph.
Global Weighted Average Total Installed Costs For Large PV Systems (with 5th percentile and 95th percentile)

Total installed cost for large PV systems decreased by about 15% on year-to-year basis in the last decade.

The 5th percentile is a value associated with the location within the data where 5% of data is below that value. In year 2020 the 5th percentile was 466 €/kWp.

The 95th percentile is the value where 5% of the data has a larger value. In year 2020 the 95th percentile was 1912 €/kWp.

Data: IRENA (2021), Renewable Power Generation Costs in 2020, International Renewable Energy Agency, Abu Dhabi. Currency converted from USD to EUR. Date of data: June 2021
Balance of System (BOS) encompasses all components of a PV system other than the PV modules; like inverter, mounting system, switches, wiring and installation work. Annual average BOS cost increased by 10.8% on y-to-y basis in 2021 and annual average PV module cost increased by 20.0% due to COVID-19 market disturbances.

Data: BSW-Solar. Graph: PSE 2021. Date of data: Nov-2021
Breakdown of Utility-scale PV Total Installed Costs
By Country in 2020

Price Learning Curve
Includes all Commercially Available PV Technologies

Learning Rate:
Each time the cumulative PV module production doubled; the price went down by 25% for the last 40 years.

Data: from 1980 to 2010 estimation from different sources: Strategies Unlimited, Navigant Consulting, EUPD, pvXchange; from 2011: IHS Markit; Graph: PSE 2021
Price Learning Curve
